

A published Cat 4+ CONUS landfall trigger — and the cell of evidence that does not exist

OPERATIONAL AS OF 01 SEP 2026 · 16:08 CT / 21:08 UTC POINT TYPE PRE-GENESIS REFERENCE CELL PACK 134661125525F27A

01 THE CONTRACT QUESTION

DISCRETE — PUBLISHED ILLUSTRATIVE TERMS · VERIFIED 13 SEP 2026

Reference event — a Category 4+ hurricane makes US landfall on or before 30 Nov 2026. Cat 4 130 mph sustained. Trigger — the hurricane centre crosses the contiguous-US coastline at Cat 4 or higher. Determination — landfall and intensity by the NHC, at landfall. Region — the lower 48, plus stated Gulf-only and Florida-only variants. PUBLIC FACTS ONLY — no access to any Discrete transaction, pricing process, client or methodology is implied, and Storm Atlas neither prices nor scores this contract.

SOURCES — 130 mph Cat 4: NHC Saffir–Simpson scale, [nhc.noaa.gov/aboutsshws.php](https://www.nhc.noaa.gov/aboutsshws.php). Determination: NHC Tropical Cyclone Reports, [nhc.noaa.gov/data/tcr](https://www.nhc.noaa.gov/data/tcr). Trigger, deadline, variants: Discrete published illustrative terms, discrete.markets/contracts/category-4-hurricane-us-landfall.

02 THE JOIN THAT IS ABSENT

the contract's event as the table the archive would hold · margins published · interior empty

8.3%

THE THREE HOLES, NAMED

1 · EXACT TRIGGER NOT SCORED. No vetted Atlas row exists for Cat 4+ at CONUS landfall; none was created here.

2 · NO MARGINAL MULTIPLICATION. The joint trigger is not estimated as reached-Cat-4 × CONUS-landfall — two marginals on one cohort are not a joint event — and CONUS — ≥64 kt is not a substitute. No such product is computed here.

3 · NO REGIONAL-VARIANT FABRICATION. Atlas holds no vetted Gulf Coast-only or Florida-only row. Cohort tracks reach Texas, Louisiana and Florida — facts about named storms and geography, not a Gulf, Florida, Texas or Louisiana rate.

03 EVIDENCE BRIDGE, EVIDENCE GAP

what is needed · what is held · the archive's verdict

DISCRETE NEEDS

→ ATLAS CURRENTLY HOLDS

→ THE ARCHIVE'S VERDICT

Intensity at the crossing, 130 mph, determined by the NHC at landfall.

The ladder scores lifetime peak, not intensity at the crossing, and the landfall contract has two forms, any and ≥64 kt — modelled geometry, not an NHC determination.

NO ≥113 KT LANDFALL ROW · A DIFFERENT DEFINITION

Which storms did this before, and where they went.

The named 12-member cohort, each member's recorded crossings and its track.

SUPPORTED AS HISTORY, NEVER AS A RATE

NAMED HISTORY — ATLAS MODELLED RECORDS, NOT NHC SETTLEMENT DETERMINATIONS. By the archive's rule (majors first, then peak descending; never similarity): ANITA 1977, the one Cat 4, has its Cat 4 crossing recorded in Tamaulipas, Mexico; ALICIA 1983, the one CONUS ≥64 kt crossing, at Cat 3 in Texas. Neither is evidence for Discrete's trigger. Conditional on formation in the declared cell — none is a probability for any live system or for Discrete's contract.

WHAT A STRUCTURER COULD USE THIS FOR — AND WHAT THIS PAGE DOES NOT DO

An auditable historical denominator — twelve named storms behind one declared condition, with an interval on each row.

A replayable cohort for counterparty review, and research input upstream of contract design — not where it is priced.

This page does not price the contract, estimate fair value, predict landfall, estimate the chance any live system triggers anything, replace the NHC, or supply settlement data. WHAT ATLAS ADDS: a declared cohort, exact n / N with a 95% Wilson interval, a visible refusal, a replay URL.

CITE THIS COHORT [REPLAY PUBLISHED COHORT · N=12 ↗](#)

STORM ATLAS · North Atlantic storms that formed within 250 km of 28.0°N 88.7°W, in August or September, in seasons from 1971 onwards, that went on to any outcome · 12 of 3,959 storms · METHODOLOGY 1.1.0 · PACK 134661125525F27A

<https://alecmessino.github.io/category-alpha/storm-atlas/?v=1&w=28%2C-88.7%2C250&s0=1971&mo=8.9&b=NA&m=1.1.0>

OPERATIONAL CONTEXT AS OF 01 SEP 2026 — NOT A CURRENT READING. NHC/ATCF classified Tropical Storm Edouard (AL052026); the operational record's first tropical-status fix was 2026-08-31T18:00:00.000Z, 28.1N 91W, TD 30 kt. NOT ATLAS GENESIS: the pack does not hold AL052026 and takes no genesis from the operational layer; the cohort remains the declared cell at 28.0°N 88.7°W, not where Edouard formed.
