

Lala paid \$200,000 — the minimum. The public contract record cannot reproduce the payout cell.

A point-in-time reconstruction from official CPHC/NHC products and the policyholder's published terms.
Reopen the evidence behind a storm trigger.

70 kt was officially reported 21 nm off Hawai'i Island, and the payout was the minimum.

The 2026 zone geometry, payout schedule, observation source and wind definition are not published, so neither the amount nor the \$100,000 difference from Lowell traces to a condition. Millibar does not infer an undisclosed contract term from an observed payout.

A. Established from public sources

Policyholder	The Nature Conservancy; first US reef policy 2022, redesigned 2024
Broker / insurer	WTW; Munich Re Group company after a competitive placement
Trigger basis	Officially reported wind; ≥50 kt in core zone; more wind and closer pays more
Wind at pass	70 kt, Forecast/Advisory 15 at 16/0300Z; 80 mph in the public advisory
Published 2024–25 limits	\$200k minimum · \$1m per event · \$2m annual
2026	\$200k minimum confirmed. Lala \$200,000 (21 Aug) · Lowell \$300,000 (15 Sep)

Historical 2024 payout ladder — not assumed for 2026

Wind	X	Y	Z	I (core)
50 kt	—	—	—	\$200k
64 kt	—	—	\$200k	\$300k
83 kt	—	\$200k	\$300k	\$450k
96 kt	\$200k	\$300k	\$450k	\$600k
113 kt	\$300k	\$450k	\$600k	\$750k
137 kt	\$450k	\$600k	\$750k	\$1.0m

\$200,000 is the floor of the 2024 schedule and sits in four cells; a minimum payout carries the least information about which condition was met.

B. Missing from the public record

- Georeferenced 2026 zone polygons
- The 2026 wind × zone payout schedule and limits
- Designated observation source and wind definition
- Treatment of intermediates and revisions

Not reconstructable from public terms

Provenance. CPHC/NHC Forecast/Advisories, Public and Intermediate Advisories, Updates, Discussions and Wind Speed Probabilities 1–64 (CP012026) · ATCF public aids · Natural Earth 1:10m · TNC 2024 fact sheet, 2025 renewal, 2026 releases · WTW 2022, 2024. Independent research by Alec Messino. Not a weather forecast, loss estimate, claims determination, or insurance advice.

C. Operational replay: selected official vintages

Solid: operational track. Dashed: Advisories 5, 9, 13, 15 (darker is later). Coastlines Natural Earth 1:10m, not contract geometry. Forecast-track distance to the Hawai'i Island coastline: Adv 5 23 nm → Adv 9 3 nm → Adv 13 7 nm → Adv 15 21 nm (derived); Advisories 1, 2, 3, 10 put the track over the island. NHC location wind probabilities, not contract payout probabilities, Adv 14: South Point 95% for 50 kt, 2% for 64 kt.

D. Residual, Advisory 13 at 16/0000Z

Both against Advisory 13's 12-hour forecast, at a synoptic hour: the closest approach at 16/0330Z falls between cycles, where no official row exists. Track direction 316.7°.

AS KNOWN AT 00Z · INTERMEDIATE 14A	REVISED AT 03Z · ADVISORY 15
–9.7 nm along	–9.7 nm along
–24.7 nm right-of-track	–24.7 nm right-of-track

Same forecast. Same valid time. Here the two source vintages report the same fix, and the residual does not move.
No ICAO aviation advisory is archived for this event; no off-cycle interpolated position is used or reconstructed.
