

Lowell paid \$300,000. The public contract record cannot reproduce the payout cell.

A point-in-time reconstruction from official CPHC/NHC products and the policyholder's published terms.
Reopen the evidence behind a storm trigger.

The 2026 zone geometry, payout schedule, designated observation source and wind definition are not published.

The 2024 fact sheet states that payouts are triggered and calculated from officially reported wind speeds and proximity to the core zone. Millibar does not infer an undisclosed contract term from an observed payout. Supplied with the schedule, the same evaluator resolves this brief deterministically.

A. Established from public sources				
Policyholder	The Nature Conservancy; first US reef policy 2022, redesigned 2024			
Broker / insurer	WTW; Munich Re Group company after a competitive placement			
Trigger basis	Officially reported wind; ≥50 kt in core zone; more wind, closer storm, larger payout			
Published 2024–25 limits	\$200k minimum · \$1m per event · \$2m annual			
2026	\$200k minimum confirmed. Lala \$200,000 (21 Aug) · Lowell \$300,000 (15 Sep)			

Historical 2024 payout ladder — not assumed for 2026				
Wind	X	Y	Z	I (core)
50 kt	—	—	—	\$200k
64 kt	—	—	\$200k	\$300k
83 kt	—	\$200k	\$300k	\$450k
96 kt	\$200k	\$300k	\$450k	\$600k
113 kt	\$300k	\$450k	\$600k	\$750k
137 kt	\$450k	\$600k	\$750k	\$1.0m

\$300,000 sits in three distinct 2024 cells; the amount alone cannot identify the condition met.

- B. Missing from the public record
- Georeferenced 2026 zone polygons
 - The 2026 wind × zone payout schedule and limits
 - Designated observation source and wind definition
 - Treatment of intermediates, corrections and revisions

Not reconstructable from public terms

Provenance. CPHC/NHC Forecast/Advisories, Public and Intermediate Advisories, ICAO aviation advisories and Wind Speed Probabilities 31–51 (EP122026) · ATCF public aids · Natural Earth 1:10m · TNC 2024 fact sheet, 2025 renewal and 2026 Lowell release · WTW releases 2022 and 2024.

Independent research by Alec Messino. Not a weather forecast, loss estimate, claims determination, or insurance advice.

C. Operational replay: selected official vintages

Solid: operational track. Dashed: Advisories 38, 42, 46, 49 (darker is later). Coastlines Natural Earth 1:10m, not contract geometry. Forecast-track distance to Ni'ihau coastline: Adv 38 131 nm → Adv 42 103 nm → Adv 46 43 nm → Adv 49 31 nm (derived). NHC location wind probabilities, not contract payout probabilities, Adv 46: Ni'ihau 71% for 50 kt, 28% for 64 kt.

D. Residual, Advisory 46 at 18Z

Both against NHC's official interpolated 18Z position, aviation advisory 46. Track direction 23.3°.

AS KNOWN AT 18Z · INTERMEDIATE 46A	REVISED AT 21Z · ADVISORY 47
−5.0 nm along	−7.3 nm along
+13.6 nm right-of-track	+8.3 nm right-of-track

Same forecast. Same valid time. The verifying observation changed with the source vintage.

Earlier Millibar 0.0 nm along-track calculation withdrawn after time-base audit.
