

Three systems, three answers

Snapshot 09 Sep 2323Z

Three atmospheric states on one Pacific chart, and three legitimate answers from the archive. None of them is a probability for the live system.

Outlook polygons as NHC issued them; dashed ring is the 500 km cell each cohort was drawn inside. No basemap.

D1 — trough SSE of Hawai'i

Outlook area, no centre

History too thin. Rates refused.

3 storms • ESS 2.5 • gate 10

3 of 10 required

D2 — forecast formation area

Analyst-declared reference cell

Conditional rates only. No composed number.

15 storms • ESS 10.5 • NHC 50%

Given formation at this cell. Bars are 95% intervals over distinct storms.

Fourteen-E — observed genesis

Operationally observed genesis • ATCF

Conditional rates, plus historical timing.

23 storms • ESS 18.2 • Cat 1 30%

Hours from genesis to hurricane strength. The forecast sits inside the spread.

Different conditioning events are not multiplied. Storm Atlas does not turn these frequencies into a probability for the live system.
